SECURITY AUDIT & VAPT

SECURE CODE REVIEW

CYBERSECURITY ADVISORY

I help startups, SaaS companies, fintech products, and growing businesses identify real security risks, improve security posture, and fix issues through manual security audits, VAPT, secure code review, and practical advisory.

Pricing: Custom based on scope, complexity, and timeline.

SERVICES

01 Security Audit & VAPT

Manual security assessment to identify real exploitable risks across your application, APIs, authentication flows, authorization logic, and business workflows. Hands-on and methodology-driven — not scanner output.

COVERS

- Web application & API security
- Authentication & session security
- Authorization & access control
- BOLA / IDOR & business logic
- Mobile application (if in scope)
- Input validation & configuration

DELIVERABLES

- Executive summary
- Severity-ranked findings
- Business impact per finding
- Proof-of-concept evidence
- Remediation guidance
- Remediation call & retest

Timeline: 3 working days – 4 weeks depending on scope.

02 Secure Code Review

Security-focused review of your codebase to identify risky implementation patterns, authorization gaps, injection paths, and business logic issues before they reach production.

COVERS

- Authentication & session logic
- Authorization & access control
- API routes & controllers
- Business logic & input validation
- Secrets, config & dependencies

DELIVERABLES

- Risk-ranked findings
- Affected files & modules
- Vulnerable code patterns
- Exploitability & business impact
- Secure implementation guidance

Timeline: 3 working days – 4 weeks depending on codebase size and scope.

03 Cybersecurity Advisory

Ongoing security guidance for teams that need senior security expertise on retainer — roadmap, release reviews, remediation support, and customer questionnaire help.

COVERS

- Security posture & roadmap
- Release security reviews
- Remediation prioritization
- Customer questionnaire support
- Pre-SOC 2 / ISO 27001 readiness

DELIVERABLES

- Monthly summary & action tracker
- Risk prioritization & roadmap
- Release review notes
- Questionnaire support

Engagement: Monthly retainer. A 3-month initial engagement is recommended for meaningful progress.

WHO I WORK WITH

- Startups and SaaS companies before a major release or funding round
- Fintech and API-heavy platforms handling user data or payments
- Engineering teams that need a real audit — not an automated scan report
- Companies preparing for SOC 2, ISO 27001, or enterprise security reviews
- CTOs and founders who need senior expertise without a full-time hire

HOW IT WORKS

- 01 Discovery call** — understand your product, concerns, and timeline
- 02 Scope questionnaire** — size the engagement accurately
- 03 Proposal** — deliverables, timeline, and pricing within 2–3 business days
- 04 Engagement** — manual assessment with a mid-engagement update
- 05 Report & remediation call** — findings walkthrough with your team
- 06 Retest** — one formal retest to verify fixes are in place

Written authorization and agreed scope are required before any testing begins.

WHAT MAKES THIS DIFFERENT

Manual, not scanner-based

Authorization flaws, business logic issues, and API abuse cases require a human analyst. Every engagement is hands-on.

Senior-level attention

Limited client load. You work directly with me — not a junior team with a senior sign-off.

Developer-friendly output

Root cause, business impact, and actionable remediation steps your engineers can act on.

Real product experience

Hands-on security work at Paytm and Lucideus across high-scale fintech and SaaS environments.
